

ASBESTOS

Often in buildings constructed prior to 1990, asbestos can cause serious health effects 10 to 30 years after exposure. Once inhaled, asbestos fibres settle in the airways and lung tissues and can cause:

- Asbestosis
- Lung Cancer
- Mesothelioma

In order to prevent these serious diseases, which can be fatal, it is absolutely necessary that asbestos be dealt with by trained professionals.

Asbestos Can be Found in:

- Flooring
- Roof Shingles/Felt
- Ceiling Stipple/Tiles
- Wall Plaster/Textures
- Exterior Siding
- Window Caulking
- Boiler Insulation
- Pipe Insulation
- Drywall Joint Compound
- Vermiculite Insulation
- Spray Applied Insulations
- Ducting Insulation
- Over 5000 Other Products

Services

- Asbestos Assessment (Conducted Prior to Renovation or Demolition) to Determine Presence & Concentration of Asbestos within Building Materials.
- Asbestos Air Monitoring & Inspections (Performed Before, During & After Asbestos Abatement)
- Asbestos Air Monitoring for Worker Exposure
- Wipe Sampling to Determine Presence of Asbestos on Settled Surfaces.
